This application is related to United States Patent Application number 1063570.5 (attorney-docket number NWISP041), filed the same day as this application, United States Patent Application number 10635744, (attorney-docket-number-NWISP042), filed the same day as this application, United States Patent Application number 10635793 (attorney-docket-number NWISP043), filed the same day as this application, United States Patent Application number 1060500 entitled "Improving Bandwidth, Framing and Error Detection in Communications Between Multi-Processor Clusters of Multi-Cluster Computer Systems," filed June 23, 2003 (attorney-docket-number-NWISP045), and to United States Patent Application numbers 10/157,384 and 10/156,893, both of which were filed on May 28, 2002. All of the foregoing applications are hereby incorporated by reference.

BACKGROUND OF THE INVENTION

The present invention relates generally to multi-processor computer systems. More specifically, the present invention provides techniques for sending signals between clusters of computer systems having a plurality of multi-processor clusters.

A relatively new approach to the design of multi-processor systems replaces broadcast communication such as bus or ring architectures among processors with a point-to-point data transfer mechanism in which the processors communicate similarly to network nodes in a tightly-coupled computing system. That is, the processors are interconnected via
